

10-FE formulation of 3D heat flow

10.1) A chimney with three channels.

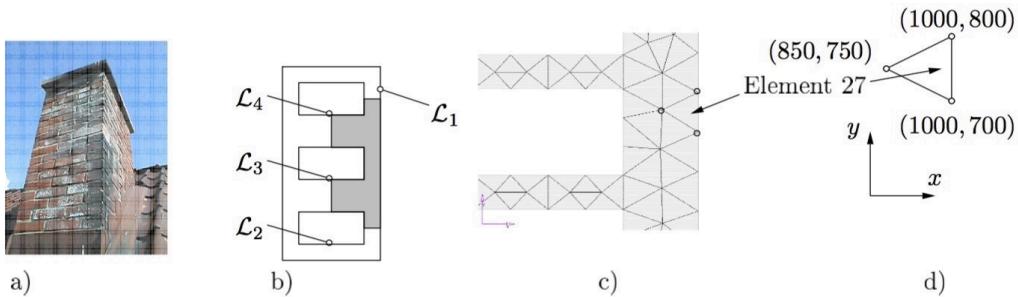

Figure 7: a) Chimney. b) Cross-section of chimney. c) FE-mesh of element 27 and its surrounding elements. d) Location of element 27

$$\operatorname{div}(q) = 0, \quad q = -k \nabla T$$

$$L_1: q_n = \alpha(T-22), \quad L_2: T=300, \quad L_3: q_n = \alpha(T-22), \quad L_4: q_n = \alpha(T-22)$$

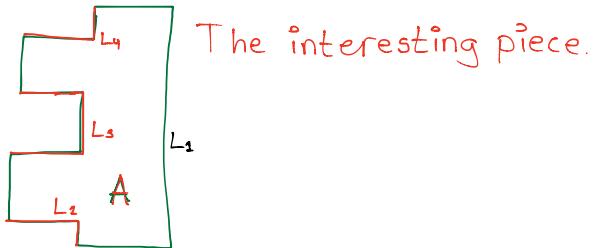

a) Derive the FE formulation

Mult. by v and integrate.

$$\int_A v \cdot \nabla(q) dA = 0$$

$$\Leftrightarrow \oint_L v \cdot \underbrace{\nabla q \cdot n}_{q_n} dL - \int_A (\nabla v)^T q \cdot n dA = 0$$

$$\Leftrightarrow \int_{L_1} + \int_{L_2} + \int_{L_3} + \int_{L_4} - \int_A$$

$$\text{Use } v = C^T N^T, \quad B = \nabla N, \quad T = N\alpha \quad \Rightarrow \nabla T = \nabla N\alpha = B\alpha$$

$$\oint_L C^T N^T t q_n dL - \int_A \underbrace{C^T B^T (-k B \alpha)}_q dA = 0$$

$$\Leftrightarrow C^T \left(\oint_L N^T t q_n dL + \int_A B^T k \alpha dA \right) = 0$$

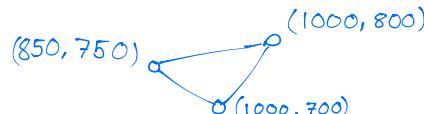

FE formulation.

$$\underbrace{\int_A B^T k \alpha dA}_K - \underbrace{\int_L N^T t q_n dL}_f \Leftrightarrow \boxed{K\alpha = f}$$

b) Calculate the element matrices for element 27.

C-matrix method

$$Q = C X \Leftrightarrow \begin{bmatrix} T_1 \\ T_2 \\ T_3 \end{bmatrix} = \begin{bmatrix} 1 & x_1 & y_1 \\ 1 & x_2 & y_2 \\ 1 & x_3 & y_3 \end{bmatrix} \begin{bmatrix} \alpha_1 \\ \alpha_2 \\ \alpha_3 \end{bmatrix}$$

$$C = \begin{bmatrix} 1 & x_1 & y_1 \\ 1 & x_2 & y_2 \\ 1 & x_3 & y_3 \end{bmatrix} = \begin{bmatrix} 1 & 850 & 750 \\ 1 & 1000 & 700 \\ 1 & 1000 & 800 \end{bmatrix}, C^{-1} = \begin{bmatrix} \frac{20}{3} & \frac{14}{3} & -\frac{31}{3} \\ -\frac{1}{150} & \frac{1}{300} & \frac{1}{300} \\ 0 & -\frac{1}{100} & \frac{1}{100} \end{bmatrix}$$

We now want to determine N^e .

$$\begin{cases} T = N\alpha \\ \alpha = c\alpha \end{cases} \Rightarrow T = N \cancel{\alpha} - N^c \alpha \quad \text{where } N = [1 \times y]$$

$$N^e = \begin{bmatrix} N_1^e & N_2^e & N_3^e \end{bmatrix}^T = \begin{bmatrix} 1 & x & y \end{bmatrix} \begin{bmatrix} \frac{20}{3} & \frac{14}{800} & -\frac{3!}{3} \\ -\frac{1}{150} & \frac{1}{800} & \frac{1}{100} \\ 0 & -\frac{1}{100} & \frac{1}{100} \end{bmatrix} = \begin{bmatrix} \frac{20}{3} - \frac{1}{150}x \\ \frac{14}{3} + \frac{1}{800}x - \frac{1}{100}y \\ \frac{3!}{3} + \frac{1}{300}x + \frac{1}{100}y \end{bmatrix}^T$$

Hmm, what is B^e ?

$$\mathbf{B}^e = \nabla^T \mathcal{N}^e = \begin{bmatrix} \delta_x \\ \delta_y \end{bmatrix} \cdot \begin{bmatrix} \frac{20}{3} - \frac{1}{150}x \\ \frac{14}{3} + \frac{1}{300}x - \frac{1}{100}y \\ \frac{31}{3} + \frac{1}{300}x + \frac{1}{100}y \end{bmatrix}^T = \begin{bmatrix} \frac{1}{150} & \frac{1}{300} & \frac{1}{300} \\ 0 & -\frac{1}{100} & \frac{1}{100} \end{bmatrix} = \frac{1}{300} \begin{bmatrix} 2 & 1 & 1 \\ 0 & -3 & 3 \end{bmatrix}$$

Element stiffness matrix.

$$K^e = \int_A B^e T B^e k dA = B^e T B^e k \int_A dA = B^e T B^e k A^e = \left(\frac{1}{300}\right)^2 \begin{bmatrix} -2 & 0 \\ 1 & -3 \\ 1 & 3 \end{bmatrix} \cdot \begin{bmatrix} -2 & 1 & 1 \\ 0 & -3 & 3 \\ 1 & 3 & 1 \end{bmatrix} k A^e = \begin{bmatrix} 4 & -2 & -2 \\ -2 & 10 & -8 \\ -2 & -8 & 10 \end{bmatrix} \frac{k A^e}{300^2}$$

Use the triangle area theorem to determine A^e

$$A^e = \frac{100-150}{2} \Rightarrow A^e = \frac{100-150}{300^2} = \frac{100-150}{300 \cdot 300 \cdot 2} = \frac{1}{32 \cdot 2} = \frac{1}{12} \Rightarrow K^e = \frac{k}{12} \begin{bmatrix} 4 & -2 & -2 \\ -2 & 10 & -8 \\ -2 & -8 & 10 \end{bmatrix}$$

Great! Well done!

$$\bar{f} = \int_{L_{23}} N^{eT} q_n dL = \int_{L_{23}} N^{eT} \alpha (T - T_\infty) dL = \int_{L_{23}} N^{eT} \alpha (N^e \alpha^e - T_\infty) dL =$$

$$= \alpha \left(\int_{t_0}^{\infty} \dots \text{FUCK THIS...} \right) = \frac{\alpha}{\delta} \begin{bmatrix} 0 & 0 & 0 \\ 0 & 2 & 1 \\ 0 & 1 & 2 \end{bmatrix} \alpha^T - \frac{\alpha T_{\alpha}}{2} \begin{bmatrix} 0 \\ 1 \\ 1 \end{bmatrix}$$

10.2) Blabla continuous current.

$$\operatorname{div}(\vec{j}) = 0 \Leftrightarrow \nabla \cdot \vec{j} = 0$$

Ohm's law: $\vec{j} = \sigma \vec{E}$, $\sigma = \sigma(x) > 0$

$$\vec{E} = -\nabla V$$

a) Determine the weak form and the FE-formulation.

I am getting tired of this...

$$\int_V \nabla \cdot \vec{j} dV = 0$$

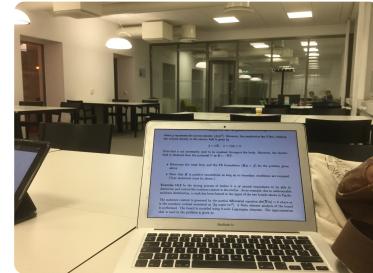

$$\Leftrightarrow \int_S \vec{v} \cdot \vec{j} \cdot \vec{n} dS - \int_V (\nabla \cdot \vec{v}) \vec{j} dV = 0$$

Use $\vec{j} = \sigma \vec{E} = \sigma \nabla V$

Weak form

$$-\int_S \vec{v} \cdot \vec{j} \cdot \vec{n} dS + \int_V (\nabla \cdot \vec{v}) \sigma \nabla V dV$$

Δ Remark: $v \neq V \neq v$

20:40 in E-huset

These V 's might be symbolically same, but they do not represent the same quantity.

Gelarkin: $V = C^T N^T$, $\nabla V = C^T B^T$
 $v = N \alpha$, $\nabla v = B \alpha$
 NOT THE SAME!

$$\Rightarrow C^T \left(\int_V B^T \sigma B dV \alpha + \int_S N^T j \cdot n dS \right) = 0$$

$$\Rightarrow \int_V B^T \sigma B dV \alpha = - \int_S N^T j \cdot n dS \Leftrightarrow [K\alpha = f] \text{ FE formulation}$$

b) Show that K is positive semidefinite.

$$K = \int_V B^T \sigma B dV, \text{ show that } x^T K x \geq 0$$

Multiply by α^T from left and α from right

$$\alpha^T K \alpha = \int_V B^T \sigma B \alpha^T dV = \int (B\alpha)^T (\sigma B\alpha) dV = \int \|B\alpha\|^2 \sigma dV = \int \|\nabla v\|^2 \sigma dV \geq 0 \quad \square$$

When does equality hold?

$$B = \nabla N = \nabla [N_1 \dots N_n]$$

$$\Rightarrow B\alpha = \nabla [N_1 \dots N_n] \begin{bmatrix} \alpha_1 \\ \vdots \\ \alpha_m \end{bmatrix}$$

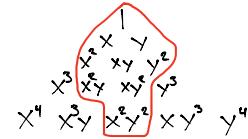

$$\alpha = [1 \dots 1]^T \Rightarrow B\alpha = \nabla (N_1 + \dots + N_n) = \nabla (1) = 0 \quad \square$$

The sum of all shape functions is equal to one.

103) Moisture

$$\operatorname{div}(\nabla m) = 0$$

$$m = \alpha_1 + \alpha_2 x + \alpha_3 y + \alpha_4 x^2 + \alpha_5 xy + \alpha_6 y^2 + \alpha_7 x^3y + \alpha_8 x^2y^2 + \alpha_9 x^3y^2$$

a) Parasitic terms?

Yes, $\alpha_7 x^3y$, $\alpha_8 x^2y^2$ & $\alpha_9 x^3y^2$. This means that the convergence order is not better than for a second degree polynomial (6-node element).

b) Does it converge?

Convergence = Completeness + compatibility

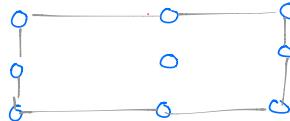

Completeness

Yes, since we have both x- and y-terms..

Compatibility

$$\begin{aligned} x=k \Rightarrow m &= \beta_1 + \beta_2 y + \beta_3 y^2 \\ y=k \Rightarrow m &= \gamma_1 + \gamma_2 x + \gamma_3 x^2 \end{aligned}$$

Since we are looking at the boundaries, we can set x (or y) to a constant.

We then have three points which must be satisfied, if we want to have unique solution, then m must be a second degree polynomial!

The solution converges!

c) Calculate the contribution from the boundary term at nodes 1, 2 & 3.

$$\left[\int_{L_{123}} \mathbf{N}^T q_n dL \right]$$

We need to derive N when y=2.

$$\mathbf{N} = [N_1 \ N_2 \ N_3 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0]$$

$$\begin{array}{c} \text{N}_1 \quad \text{N}_2 \quad \text{N}_3 \\ \text{---} \quad \text{---} \quad \text{---} \\ \text{Q} \quad \text{C} \quad \text{O} \end{array} \quad \begin{cases} N_1 = (x-1)(x-2) \cdot \frac{1}{2} \\ N_2 = -x(x-2) \\ N_3 = x(x-1) \cdot \frac{1}{2} \end{cases}$$

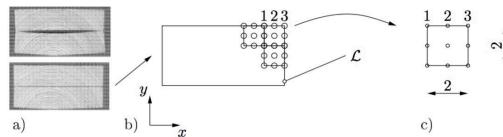

Figure 8: a) Two boards that have been dried under different conditions. b) The boundary and three elements that are used in the finite element analysis of the moisture problem. c) One 9-node Lagrangian element.

$$\Rightarrow \int_0^2 [N_1 \ N_2 \ N_3 \ 0 \ 0 \ 0 \ 0 \ 0 \ 0] q_n dx = \left[q_n \left[\begin{matrix} \frac{1}{6}x^3 - \frac{3}{4}x^2 + x \\ -\frac{1}{3}x^2 + x^2 \\ \frac{1}{6}x^3 - \frac{1}{4}x^2 \end{matrix} \right] \right]_0^2 = q_n \begin{bmatrix} 1/3 \\ 4/3 \\ 1/3 \end{bmatrix}$$

VF SKA DET
BLI GGR 2 FÖR
SISTAT!

10.4) Diffusion problem.

$$\operatorname{div}(\nabla c) = 0$$

$$\begin{aligned}\frac{\partial c}{\partial x} &= 0 \quad \text{along } x = 0; & \frac{\partial c}{\partial x} &= 1 \quad \text{along } x = 1 \\ c &= 1 \quad \text{along } y = 0; & \frac{\partial c}{\partial y} + c &= 2 \quad \text{along } y = 1\end{aligned}$$

a) Derive the FE formulation.

$$\int_A v \operatorname{div}(\nabla c) dS = 0$$

$$\Leftrightarrow \int_L v (\nabla c)^T \bar{n} dL - \int_A (\nabla v)^T (\nabla c) dS = 0$$

$$\text{Galerkin: } v = C^T N^T, \nabla v = C^T B^T$$

$$c = Na, \nabla c = Ba$$

$$\Rightarrow C^T \left(\int_L N^T (\nabla c)^T \bar{n} dL - \int_A B^T B dS \alpha \right) = 0$$

$$\Rightarrow \int_L N^T (\nabla c)^T \bar{n} dL - \int_A B^T B dS \alpha = 0 \Leftrightarrow K \alpha = f$$

b) Determine the concentration along $y = 1$.

We would really like to find the element form functions.

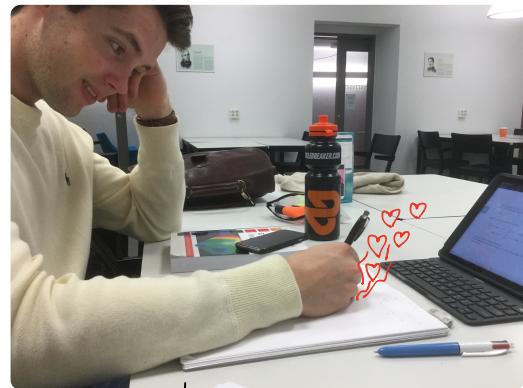

Lagrange

$$C = \underbrace{\frac{(x-1)(y-1)}{(0-1)(0-1)}}_{N_1^e} + \underbrace{\frac{x(y-1)}{(0-1)}}_{N_2^e} + \underbrace{xy}_{N_3^e} + \underbrace{\frac{(x-1)y}{(0-1)}}_{N_4^e} =$$

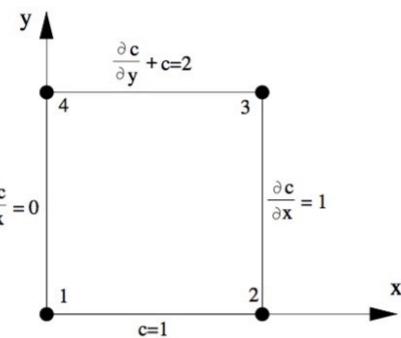

$$= (x-1)(y-1) - x(y-1) + xy - (x-1) \cdot y$$

$$\Rightarrow N^e = \begin{bmatrix} (x-1)(y-1) & -x(y-1) & xy & -(x-1) \cdot y \end{bmatrix}$$

$$B^e = \nabla N^e = \begin{bmatrix} \frac{\partial}{\partial x} \left[(x-1)(y-1) \right] & -x(y-1) & xy & -(x-1) \cdot y \\ \frac{\partial}{\partial y} \left[(x-1)(y-1) \right] & (x-1) & -x & 0 \end{bmatrix} = \boxed{\begin{bmatrix} y-1 & 1-y & y & -y \\ x-1 & -x & x & 1-x \end{bmatrix}} B^e$$

E-huset 22:01

Scroll to the next page to find K .

Finding K.

$$K = \int_A B^T B dS = \iint_{\Delta} B^T B dx dy = \dots = \dots = \dots = \frac{1}{6} \begin{bmatrix} 4 & -1 & -2 & -1 \\ -1 & 4 & -1 & -2 \\ -2 & -1 & 4 & -1 \\ -1 & -2 & -1 & 4 \end{bmatrix}$$

Finding f.

$$f = \oint_{L} N^T (\nabla c)^T \hat{n} dL = \int_{L_{12}} + \int_{L_{23}} + \int_{L_{34}} + \int_{L_{41}}$$

$$N^T = \begin{bmatrix} (1-x)(-y) & -x(y-1) & xy & -(x-1)y \end{bmatrix}^T$$

$$\int_{L_{12}} = \int_0^1 [1-x \quad x \quad 0 \quad 0]^T (\nabla c)^T \hat{y} dx = \boxed{0} \quad |_{L_{12}}$$

$$\int_{L_{23}} = \int_0^1 [0 \quad 1-y \quad y \quad 0]^T (\nabla c)^T \hat{x} dy = \int_0^1 [0 \quad 1-y \quad y \quad 0]^T \cdot 1 dy = \boxed{0 \quad 1-\frac{1}{2} \quad \frac{1}{2} \quad 0}^T \quad |_{L_{23}}$$

$$\int_{L_{34}} = \int_0^1 [0 \quad 0 \quad x \quad 1-x]^T (\nabla c)^T \cdot \hat{y} dx$$

What about ∇c ?

$$\frac{dc}{dy} + c = 2 \Leftrightarrow \frac{dc}{dy} = 2 - c = 2 - N\alpha$$

$$\Rightarrow (\nabla c) = \left(\frac{dc}{dx}, 2 - N\alpha \right)$$

$$\Rightarrow (\nabla c)^T \hat{y} = 2 - N\alpha$$

$$\Rightarrow \int_{L_{34}} = \int_0^1 N^T (2 - N\alpha) dx = \int_0^1 2 B^T - N^T N \alpha dx = \int_0^1 \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & x^2 & x(1-x) \\ 0 & 0 & (1-x)x & (1-x)^2 \end{bmatrix} \alpha dx =$$

$$= \left[2 \begin{bmatrix} 0 \\ 0 \\ 0 \\ x^2 \end{bmatrix} - \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{x^2}{3} & \frac{x^2 - x^3}{3} \\ 0 & 0 & \frac{x^2 - x^3}{3} & \frac{-(1-x)^3}{3} \end{bmatrix} \alpha \right] \Big|_0^1 = 2 \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1/2 \end{bmatrix} - \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 1/3 & 1/6 \\ 0 & 0 & 1/6 & 1/3 \end{bmatrix} \alpha = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 1 \end{bmatrix} - \frac{1}{6} \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 1 \\ 0 & 0 & 1 & 2 \end{bmatrix} \alpha$$

Add this to the f-vector Add this to the K matrix.

$$\int_{L_{41}} = \int_0^1 N^T (\nabla c)^T \hat{n} dx$$

$$\hat{n} = -\hat{x} \Rightarrow (\nabla c)^T \hat{n} = -\frac{dc}{dx}$$

$$\frac{dc}{dx} = 0 \Rightarrow (\nabla c) \cdot \hat{n} = 0 \Rightarrow \int_{L_{41}} = \boxed{0} \quad |_{L_{41}}$$

Maple

$$B := Matrix(2, 4, [y-1, 1-y, y, -y, x-1, -x, x, 1-x])$$

$$Transpose(B), B$$

$$map(int, Transpose(B), B, y=0..1, x=0..1)$$

$$\begin{bmatrix} \frac{20}{3} - \frac{1}{150} x \frac{14}{3} + \frac{1}{300} x^2 - \frac{1}{100} x^3 + \frac{31}{3} + \frac{1}{300} x + \frac{1}{100} y \\ y-1 \quad 1-y \quad y \quad -y \\ x-1 \quad -x \quad x \quad 1-x \end{bmatrix}$$

$$\begin{bmatrix} (y-1)^2 + (x-1)^2 & (y-1) (1-y) - (x-1) x & (y-1) x + (x-1) x & -(y-1) y + (x-1) (1-x) \\ (y-1) (1-y) - (x-1) x & (1-y)^2 + x^2 & (1-y) y - x^2 & -(1-y) y - x (1-x) \\ (y-1) y + (x-1) x & (1-y) x - x^2 & x^2 + y^2 & -y^2 + x (1-x) \\ -(y-1) y + (x-1) (1-x) & -(1-y) y - x (1-x) & -y^2 + x (1-x) & y^2 + (1-x)^2 \end{bmatrix}$$

$$\begin{bmatrix} \frac{2}{3} & \frac{1}{6} & \frac{1}{3} & \frac{1}{6} \\ -\frac{1}{6} & \frac{2}{3} & -\frac{1}{6} & \frac{1}{3} \\ \frac{1}{3} & -\frac{1}{6} & \frac{1}{2} & \frac{1}{3} \\ -\frac{1}{6} & -\frac{1}{3} & \frac{1}{6} & \frac{2}{3} \end{bmatrix}$$

Put everything together:

$$f = \int_{L_{12}} + \int_{L_{13}} + \int_{L_{34}} + \int_{L_{41}} = \begin{bmatrix} 0 \\ 1/2 \\ 1/2 \\ 0 \end{bmatrix} + \begin{bmatrix} 0 \\ 0 \\ 1 \\ 1 \end{bmatrix} = \begin{bmatrix} 0 \\ 1/2 \\ 3/2 \\ 1 \end{bmatrix}$$

We had $K\alpha = f$ but since f seems to have a matrix part we now define:

$$\tilde{K}\alpha = \tilde{f} \quad \text{where } \tilde{K} = K - M = \frac{1}{6} \begin{bmatrix} 4 & -1 & -2 & -1 \\ -1 & 4 & -1 & -2 \\ -2 & -1 & 4 & -1 \\ -1 & -2 & -1 & 4 \end{bmatrix} + \frac{1}{6} \begin{bmatrix} 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & 0 \\ 0 & 0 & 2 & 1 \\ 0 & 0 & 1 & 2 \end{bmatrix} = \begin{bmatrix} 4 & -1 & -2 & -1 \\ -1 & 4 & -1 & -2 \\ -2 & -1 & 6 & 0 \\ -1 & -2 & 0 & 6 \end{bmatrix} \quad K$$

and $\tilde{f} = \begin{bmatrix} 0 \\ 1/2 \\ 3/2 \\ 1 \end{bmatrix}$

$$\tilde{K}\alpha = \tilde{f} \Leftrightarrow \alpha = \tilde{K}'\tilde{f} = \text{Maple}/=$$
